

POCKETSMART AI

File 1 — Brainstorming and Ideation

1. Project Concept

PocketSmart AI is a Generative AI-powered budget and recommendation assistant designed to help users make practical purchasing and planning decisions within a defined budget. The system is intended for use cases such as home decor, event planning, jewellery shopping, and other categories where users must compare many products or services across different platforms.

2. Problem Identification

Users often face difficulty when planning purchases because products and services are distributed across multiple platforms, have different price ranges, and may offer different features. Manually searching, comparing, filtering, and checking whether options fit a budget can be time-consuming.

Identified Challenge	Effect on the User
Too many products and services	Difficult to shortlist suitable options
Different price ranges	Hard to stay within a fixed budget
Multiple platforms	Requires repeated searching and comparison
Unstructured information	Important features may be missed
Planning uncertainty	Users may not know how to allocate their budget

3. Brainstorming Objectives

- Create an AI assistant that understands a user's budget and requirements.
- Generate recommendations relevant to the user's stated needs.
- Help users explore options without manually comparing large numbers of listings.
- Support different real-world planning and shopping categories.
- Use Generative AI to provide natural-language explanations and recommendations.

4. Initial Feature Ideas

Feature	Purpose
Budget Input	Allow users to specify the amount they are willing to spend.
Requirement Input	Capture preferences, category, quantity, style, or other needs.
AI Recommendations	Generate suitable options based on budget and requirements.
Cross-Platform Concept	Consider products/services from different online sources.
Recommendation Explanation	Explain why an option may fit the user's requirements.
Budget Awareness	Keep recommendations aligned with the available budget.
Natural-Language Interaction	Allow users to describe their needs conversationally.

5. Target Use Cases

- **Home Decor:** Recommend decor items or combinations within a specified budget.
- **Event Planning:** Help plan purchases or services for an event according to a budget.
- **Jewellery Shopping:** Suggest jewellery options based on budget and preferences.
- **General Shopping:** Help users shortlist products when there are many choices.

6. Proposed AI Approach

The initial idea is to use a Generative AI model to interpret the user's natural-language request, identify budget and preference constraints, and produce structured recommendations. The project concept specifies Gemini as the Generative AI component. The recommendation layer can then present the resulting options in a user-friendly interface.

7. Expected Outcome

The brainstorming phase establishes PocketSmart AI as a budget-aware recommendation assistant rather than a conventional product catalogue. The core idea is to reduce the effort required to move from a user's budget and requirements to a manageable set of relevant recommendations.

8. Summary of the Ideation Phase

Aspect	Decision / Direction
Project Name	PocketSmart AI
Primary Goal	Budget-based AI recommendations
Core Technology	Generative AI / Gemini API
Interaction	Natural-language user requirements
Main Constraint	User-defined budget
Initial Domains	Home decor, event planning, jewellery, general shopping
Expected Benefit	Simpler discovery and comparison of suitable options
