

# PocketSmart AI

Project Demonstration — File 8

## 1. Demonstration Objective

This demonstration presents the end-to-end working concept of PocketSmart AI: the user provides a requirement and budget, the application processes the request using generative AI, and the system displays budget-aware recommendations.

## 2. Demonstration Flow

### Step 1 — Launch the Application

Open the deployed or local PocketSmart AI application and display the main interface.

### Step 2 — Introduce the Use Case

Explain that PocketSmart AI helps users make budget-conscious recommendations for use cases such as home décor, event planning, or jewelry shopping.

### Step 3 — Enter User Requirement

Enter a realistic requirement describing what the user wants to purchase or plan.

### Step 4 — Enter the Budget

Provide the user's available budget and any important preferences.

### Step 5 — Submit the Request

Submit the request so the recommendation workflow can process the user's inputs.

### Step 6 — AI Processing

Explain that the generative AI layer interprets the requirement, budget, and preferences.

### Step 7 — Display Recommendations

Show the recommendations returned by the application and explain how they relate to the supplied budget.

### Step 8 — Review the Results

Review the generated options and demonstrate how the user can use the information to compare alternatives.

### Step 9 — Demonstrate Another Category

Repeat the process with another supported category to demonstrate that the concept is not limited to one use case.

### Step 10 — Explain the Technology

Briefly identify the frontend, application logic, and Google Gemini-based generative AI components.

## 3. Suggested Demonstration Scenario

**Example:** A user wants to plan an event with a fixed budget. The user enters the event requirement, specifies the budget, and submits the request. PocketSmart AI processes the information and generates recommendations appropriate to the stated requirement and budget. The presenter then reviews the

generated output.

## 4. What to Show on Screen

- PocketSmart AI landing or dashboard screen.
- User requirement input.
- Budget input.
- Recommendation request / submit action.
- AI-generated recommendation results.
- A second example or category, if available.
- Any relevant error or loading state only if needed to explain system handling.

## 5. Demonstration Script

**Opening:** “This is PocketSmart AI, a GenAI-powered budget and recommendation assistant.”

**Problem:** “Users often have difficulty finding suitable options when they have a fixed budget.”

**Input:** “Here I enter my requirement and specify the amount I am willing to spend.”

**Processing:** “The application sends these requirements to the AI recommendation layer.”

**Output:** “The system now provides recommendations based on the requirement and budget.”

**Explanation:** “The purpose is to make the initial discovery and comparison process faster and simpler.”

**Closing:** “This demonstrates the complete user-to-recommendation workflow of PocketSmart AI.”

## 6. Video Recording Checklist

| No. | Recording Check                                |
|-----|------------------------------------------------|
| 1   | Application opens successfully                 |
| 2   | User input is clearly visible                  |
| 3   | Budget value is clearly visible                |
| 4   | Submit/request action is demonstrated          |
| 5   | AI processing/result is shown                  |
| 6   | Recommendation output is readable              |
| 7   | At least one complete use case is demonstrated |
| 8   | Technology stack is briefly explained          |
| 9   | Video has a clear beginning and ending         |

## 7. Presentation Notes

Keep the demonstration focused on one complete user journey. Avoid spending excessive time on installation or source code unless specifically requested. Clearly distinguish between the user's inputs,

the AI processing stage, and the recommendations displayed by the application.

## **8. Expected Demonstration Outcome**

At the end of the demonstration, the viewer should understand the problem addressed by PocketSmart AI, how a user interacts with the application, how budget information influences the recommendation request, and how the generative AI component contributes to the final output.
